

HIGH ROCK MATERIALS, LTD.

GEORGE TOWN, GRAND CAYMAN
CAYMAN ISLANDS

PROJECT VISION

After years of hard work, planning, and due diligence, High Rock Materials, Ltd. (“High Rock”), a Signet subsidiary, announced its plans to develop and operate a rock quarry in the Cayman Islands. The entire operation was designed from the ground-up.

High Rock will perform open pit conventional mining for the purpose of providing crushed stone for construction projects across the Cayman Islands.

The Cayman Islands are the coral peaks of a massive underwater ridge that is mostly flat and swampy. As such, each construction project on the Cayman Islands requires some level of aggregate material, making quarry operations a very important industry in the local economy and crushed stone a much needed product in the country.

THE PROJECT

High Rock is proud of its environmentally friendly approach to the project, as our operation will reclaim aggregate material from an existing 43-acre marl lake. By doing so, High Rock will leave virgin land untouched and maintain the Cayman Island’s current footprint.

High Rock worked closely with the Cayman Islands Government on this approach, securing all the necessary approvals and permits for the project.

High Rock’s operations can be broken down into the following categories:

- Drilling and Blasting
- Excavation / Digging
- Material Processing (Crushing)
- Transport

High Rock’s final product will exceed the highest level of specification requirements for the construction market on the Cayman Islands.

High Rock Materials, a Signet subsidiary, has developed and will soon operate a rock quarry on the Cayman Islands. This project will produce various grades of construction aggregate that will provide crushed stone for construction projects across the Cayman Islands.
